The invention discloses a composition comprising two or more isolated rate or purposition comprising two or more isolated rate or burnan polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in a naimal subjected to pain and a subjected to pain, a method for identifying a nucleotide sequence that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of a polynucleotide sequence which is differentially expressed in nucleonid which regulates the subjected to pain, a method for identifying a compound which regulates the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the compound that regulates the activity of one or more of the cartivity in an animal of one or more of the polypeptides given in the specification, a method for identifying a compound useful in treating pain and a pharmacutical composition comprising the one or more of the compound that set is activity is useful for preparing a method for identifying a compound useful in treating pain (e.g. spinal segmental nerve injury (SMI) in an animal of one or more of the specification) which is differentially expressed during pain. Note: the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at Exp. XX
New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ċ
                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to gene sequences (ABI99915-ABI99914) having modified expression in fetal heart tissue as compared to adult heart tissue and the encoded proteins (ABB57375-ABB57392). The genes have cardiant activity and may be useful in the promotion of the repair of damage to heart tissue caused by myocardial necrosis. The gene sequences are useful for screening potential compounds for the ability to influence disease associated with myocardial necrosis. Drugs identified by the screening methods may be used to treat and prevent disease with which myocardial necrosis is associated, such as cardiac hypertrophy and cardiac insufficiency. Disgnosis of diseases such as those above is also disclosed. (Updated on 07-AUG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

The invention discloses a composition comprising two or more isolated rate or human polynucleotides or a polynucleotide which represents a fragment, definition or allelior variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector a method for identifying a nucleotide sequence which is differentially responsable to a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the polynpeptides or their antibodies. The polynucleotide or the compound that composition comprising the one or more polynpeptides or their antibodies. The polynucleotide or the compound that in treating pain (e.g. spinal segmental nerve injury (Shun), chronic constriction injury (CI) and spared nerve injury (Shun) in an animal (e.g. gene the sequence data for this patent did not form part of the printed sequence data for this patent did not form part of the printed sequence or the function but was obtained in electronic form directly from MIPO at the print of the polynchales.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                           New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Rat; pain; neuronal tissue; gene therapy; spinal segmental nerve injury; chronic constriction injury; CCI; spared nerve injury; SNI; Chung.

claimed are a vector comprising the nucleic acid sequence. Association for the nucleic acid sequence. Association of the nucleic acid sequence which is differentially required in a animal subjected to pain and a nucleotide sequence which is differentially expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal cuberted to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the opposition, a compound that regulates the activity of one or more of the activity in an animal of one or more of the polypetides given in the activity in an animal of one or more of the polypetides given in the activity in an animal of one or more of the polypetides given in the specification, a method for identifying a compound useful in treating pain and a pharmacutical composition comprising the one or more of pain and a pharmacutical composition comprising the one or more of pain and a pharmacutical composition comprising the one or more of pain and a pharmacutical composition comprising the one or more of pain and a pharmacutical capacitic for a spinal segmental nerve injury (CLI) and spared nerve injury (SNI) in an animal (e.g. spen the printed in the printed of the specification) which is differentially expressed during pain. Note: The sequence data for this patent did not form part of the printed or presented in electronic form directly from WIPO at
                                                                                                                                                                                                                                                                         The invention discloses a composition comprising two or more isolated rat or human polynuclectides or a polynuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Ligands binding to the receptor-type protein tyrosine phosphatase sigma such as differentiation, metabolism and cell cycle control, and cellular behaviour such as differentiation, metabolism and cell cycle control, and cellular behaviour such as motility and contact inhibitions. In addition they may affect abnormal or potentially deleterious processes such as virus-ceeptor interactions, inflammation and cellular transformation to a cancerous state. They may also be used to treat RPTP sigma related neuronal disorders such as neuroblastomas. The DNA encoding the RPTP sigma is useful for the diagnosis of diseases resulting from its aberrant detection and quantitative analysis. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                Movel, isolated receptor-type protein tyrosine phosphatase-sigma - and encoding DNA, useful e.g. for detecting neuro-blastomas.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 2; Fig 2; 105pp; English.

                                                                                                                                                                                                                                                                                                                                                                                               The invention discloses a composition comprising two or more isolated rate or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector, a method for identifying a nucleotide sequence which is differentially regulated in a animal subjected to pain and a bubjected to pain, a method for identifying a nucleotide sequence that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in merional tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the polympetides given in the specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more polympetides or their antibodies. The polymucleotide or the compound that injury (CCI) and spared nerve injury (SMI) in an animal (e.g. gene thersapy). The sequence presented is a rat protein (shown in Table 2 of the sequence data for this patent did not form part of the printed specification) which is adifferentially expressed during pain. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the printed and the properties of the printed and electronic form darted the presented in electronic form darted the printed and the printed and the printed and the printed and the printed and the printed and the printed and the presented and electronic form darted the presented and electronic form dar

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated polypeptide, which is a human kinase and phosphatase (KPP). KPP agonists and antagonists are useful for diagnosing, treating or preventing disorders associated with aberrant expression of KPP, particularly Cell profilerative disorders (e.g. arteriosclerosis, atherosclerosis, cirrhosis, hepatitis, parcoxysmal nocturnal haemoglobinuria, polycytheamia vera, psoriasis, primary thromobocytopaemia or cancer), developmental disorders (e.g. renal tubular acidosis, anaemia or mental retardation), neurological disorders (e.g. Alzheimer's disease, parkinson's disease or epilepsy), autoimmune/ inflammatory disorders (e.g. AlIDs, acquired immune deficiency syndrome, allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's allergies, asthma, autoimmune thyroiditis, contact dermatitis, Crohn's allergies, asthma, autoimmune thyroiditis, doodpasture's syndrome, multiple sclerosis, osteoarthritis, osteoporosis, pancreatitis, Reiter's syndrome, rheumatoid arthritis, Sjogren's syndrome, useful in assessing the effects of exogenous compounds on the suseful in assessing the effects of exogenous compounds on the cyperological and kinases and phosphatases. KPP gene is useful in gene therapy and for creating transgenic animals to model human disease. The present sequence is human KPP protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the composition, a compound that regulates the activity of one or more of the composition, a method for identifying a pharmaceutical composition or more of the polypeptides given in the specification, a method for identifying a compound useful in treating corputed for identifying a compound useful in treating pain and a pharmaceutical composition composition composition composition composition composition for identifying a medicament for treating composition composition composition constriction injury (Ctl) and spared nerve injury (Chung), chronic constriction injury (Ctl) and spared nerve injury (Chung), othronic constriction injury (Ctl) and spared nerve injury (SNI) in an animal (e.g. gene the sequence data for this patent and of orm contribution and pharmaceutical (shown in Table 2 of the sequence data for this patent and of orm contribution and pharmaceutical composition construction the sequence data for this patent and of orm contribution of the polynocide or the polynocide or the sequence data for this patent and of orm part of the printed or the sequence data for this patent and of orm contributions of the sequence of the contribution of the contribution of the contribution of the cont
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This sequence is the protein tyrosine phosphatase LAR. The invention relates to an antibody specifically recognising the intracellular domains of two or more protein tyrosine phosphatases (PPPs). The antibody is useful for the detection and assay of PTP including novel phosphatases generated by cloning; and diagnosis, treatment and prevention of insulin resistance related diseases and non-insulin dependent diabetes mellitus, syndrome X and arteriosclerosis and heart disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Antibody for diagnosis and treatment of insulin resistance disorders and syndrome X recognises the intracellular domains of tyrosine kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Intracellular domain; P-subunit; human; leucocyte antigen related; LAR; tyrosine phosphatase; antibody; thyroid cancer.

                                                                                                                                                                                                                                            LAR (leukocyte antigen related), a negative regulator of epithelial cell migration and timour formation, for which beta-catenin is a substrate. A dysfunction of PTP LAR may lead to tumour invasion and metastasis. The invention of PTP LAR may lead to tumour invasion and metastasis. The invention provides methods for diagnosing, preventing, or treating disease or disorder characterized by epithelial cell migration, increased tyrosine phosphorylation of beta-catenin, and/or increased levels of the pool of free beta-catenin, especially cancer, metastasis and aberrant wound healing (claimed). The methods may also be used to treat diseases and disorders with abnormal cell proliferative conditions, including fibrotic and mesangial disorders, abnormal angiogenesis and vasculogenesis, psoriasis, diabetes mellitus and inflammation. Methods are provided for identifying compounds that modulate PTP LAR activity for

                                                                                                                                                                         This invention relates to novel human genes and gene product which are implicated in certain disease states. Compounds which modulate the proteins of the invention may have eyeostatic, antiinflammatory, ophthalmological, antiarteriosclerotic or vulnerary activities. The sequences of the invention may be useful for gene therapy. The invention may be useful for gene therapy. The invention may be useful for gene therapy. The invention such as tumourigenesis, anglogenesis, apoptosis, inflammation, such as tumourigenesis, anglogenesis, apoptosis, inflammation, expthropoiesis or the biological response to hypoxia conditions including processes such as glycolysis, glucomogenesis, glucose transportation, catecholamine synthesis, iron transport or nitric oxide synthesis. The disease includes cancer, ischaemic conditions reperfusion inflammatory conditions or wound healing. The present sequence is that of a disease related protein of the invention.
New substantially purified polypeptide, useful for diagnosing or treating a hypoxia-regulated condition, such as cancer, ischemia, reperfusion injury, retinopathy, pre-eclampsia, atherosclerosis, inflammation, or wound healing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Examining the ischemic condition (e.g. occlusive ischemia) by measuring expression levels of particular genes defined in the specification or by determining the expression profile of a gene group comprising these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Mouse ischaemic condition related protein sequence SEQ ID NO:224.

The present invention describes a method for examining ischaemic conditions, comprising measuring the expression levels of particular genes (I) in a test sample or determining the expression profile of a gene group in the sample or determining the expression profile of a schaemia or or usospariating genes selected from (I). The method is useful for examining the ischaemia condition (e.g. compressive tischaemia, occlusive ischaemia or vasospastic ischaemia) by measuring expression levels of particular genes (AB199202 to AB199312, encoding the protein sequences in ABB57020 to ABB57374) or by determining the protein sequences in ABB57020 to ABB57374) or by determining the indicator when screening for ischaemic condition-improving drugs or therapputics for ischaemic diseases. AB199913 and AB199914 represent PCR primers for a mouse ischaemic condition related sequence, which are used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

ò The invention relates to polynucleotides encoding novel human proteins on their active domains. The polypeptides, polynucleotides and antibodies raised against the polypeptides are used in a method of treatment of a mammal and prevention of disorders caused by the aberrant protein expression or activity. The polypeptides can be used as molecular weight

WPI; 1995-131318/17.

cc markers, food supplements, and in antibody production. The polypeptides

cr are used to identify compounds which bind to the polypeptides.

CC Polymorlectides of the invention are used as probes and primars, for
sequencing, for chromosome or gene mapping, in the production of
crecombinant proteins, and in generating anti-sense DNA or RNA and in gene

CC therapy. Polypeptides of the invention can be used to carget drugs to a

cumple of an immune response, to determine quantitative protein

cc tumour, in assays to determine biological activity, to raise

antibodies/elicit an immune response, to determine quantitative protein

cc levels, as tissue markers, and to isolate receptors or ligands.

```
Protein tyrosine phosphatase denoted PTP-OB - useful for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Protein tyrosine phosphatase; PTP; human; osteoporosis; bone formation; PTP-OB; cell proliferation; cell death; neoplastic transformation;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This represents a human protein tyrosine phosphatase (PTP) denoted as -0B, produced by bone and brain cells. A recombinant host cell transfected or transformed with a nucleic acid vector comprising the nucleic acid can be used for the production of the PTB-OB polypeptide. The protein can be used to screen for modulators of PTP-OB activity, which might be useful for treating e.g. osteoporosis and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence represents human protein tyrosine phosphatase (PTP-OB) protein. The DNA encoding this protein is useful for the production of the recombinant protein, which is a protein tyrosine phosphatase which brain be involved in the growth and differentiation of osteoblasts and brain cells and is useful for identifying compounds that modulate PTP-OB activity and as a therapeutic agent for treating PTP-OB-related diseases.                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                        PCR amplification of cDNA derived from human osteosarcoma Saos-2/B10 using primers based on conserved regions of protein tyrosine phosphatases and subsequent screening of a human brain cDNA library yielded a cDNA clone (sequence given in AAQ86473) that encoded a novel human protein, prp-OB (AAR71726). Recombinant PTP-OB was expressed in E. coli, yeast, insect and mammalian celis. (Updated on 25-MAR-2003 to correct PN field.)
                                       Protein tyrosine phosphate protein PTP-OB specifically expressed in bone cells - modulators of which are used to treat, e.g. osteoporosis, and prevent and treat bone loss and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding protein tyrosine phosphatase PTP-OB - isolated from human osteoblasts and useful for production of recombinant PTP-OB.
                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 1911;

The PTP-0B nucleic acid and protein sequences were used in method to identify a compound able to modulate PTP-0B activity, involving contacting a recombinant polypeptide comprising the entire of typoblasmic domain of PTP-0B with the compound, and measuring the ability of the compound to modulate PTP-0B with the compound. And measuring the ability of the compound to modulate PTP-0B with the compound to modulate pTP-0B with the states involving pTP-0B activity such as estepoporosis, for preventing and treating bone loss, and stimulation of bone formation. The compounds are also useful for treating diseases in which activation or inactivation of PTP-0B protein results in either cellular proliferation, cell death, nonproliferation, induction of cellular neoplastic transformations or metastatic tumour growth, such as cancer, preferably lung cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antiarteriosclerotic; vulnerary; gene therapy; hypoxia-regulated condition; tumourigenesis; angiogenesis; apoptosis; inflammation; erythropiesis; glycolysis; gluconeogenesis; glucose transportation; catecholamine synthesis; iron transport; infirito exide synthesis; cancer; ischaemic condition; reperfusion injury; retinopathy; neonatal stress; pre-eclampsia; atherosclerosis; inflammatory condition; wound healing.
                                                                                                                                                                                                                                                                                                                                                                                            Identifying a compound which modulates protein tyrosine phosphatase activity for treating osteoporosis, comprises contacting a polypeptide with a compound and measuring the ability of the compound to modulate polypeptide activity.

This invention relates to novel human genes and gene product which are implicated in certain disease states. Compounds which modulate the proteins of the invention may have exptostate, antinflammatory, ophthalmological, antiarteriosclerotic or vulnerary activities. The sequences of the invention may be useful for gene therapy. The invention may be useful for disgnosing or treating a hypoxia-regulated condition, such as tumourigenesis, angiogenesis, apoptosis, inflammation, extheropoiesis, or the biological response to hypoxia conditions including processes such as glycolysis, gluconegenesis, gluconegenesis, sputchesis, The disease includes cancer, ischaemic conditions, reperfusion injury, retinopathy, neonatal stress, pre-eclampsia, atherosclerosis, inflammatory conditions or wound healing. The present sequence is that of a disease related protein of the invention.
                                                                                                                                                                                                                                                                                                        New substantially purified polypeptide, useful for diagnosing or treating a hypoxia-regulated condition, such as cancer, ischemia, reperfusion injury, retinopathy, pre-eclampsia, atherosclerosis, inflammation, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention discloses a composition comprising two or more isolated rate or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also comprising the vector, a method for identifying a nucleotide sequence which is differentially repressed in an animal subjected to pain and a method for identifying an agent that increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the polymoral composition, a method for identifying a compound that regulates the activity of one or more of the polymoral composition, a method for identifying a compound that regulates the activity in an animal of one or more of the polymoral est the activity in an enthod for identifying a compound that regulates the activity in an animal of one or more of the polymoral est in treating pain method for identifying a compound that regulates the activity in an animal of one or more of the polymoral est in treating pain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CI) and spared nerve injury (SNI) in an animal (e.g. gene the sequence draw injury (SNI) in an animal est from treating the sequence data for this patent did not form part of the printed segmental nerve injury (SNI) in an animal constriction the specification which is differentially expressed during pain. Note:

The sequence data for this patent did not form part of the printed
                                                                                                                                                                                                                                                                            New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; pain; neuronal tissue; gene therapy;

The invention discloses a composition comprising two or more isolated rate or human polymuclectides or a polymuclectide which represents a fragment, or human polymuclectides or a polymuclectide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polymuclectide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a array, a method for identifying an agent that increases or decreases the expression of the polymuclectide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymuclectide sequence which is differentially compound that regulates the activity of one or more of the polymuclectides, a method for producing a pharmaceutical composition, a compound that regulates the activity of one or more of the oplymotlectides, a method for identifying a compound or small molecule that regulates the activity in an animal of one or more of the polymotlectides or their inhibition, a method for identifying a compound useful in treating or polymeptides or their antibodies. The polymotlectide or the compound that modulates its activity is useful for preparing a medicament for treating constriction injury (CCI) and spared nerve injury (SNI) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of the specification, but was obtained in electronic form directly from WIPO at Etp.wipo.int/pub/published_pot_genence.
                                                                                                                                                                                                                                                                                                                New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.

The invention discloses a composition compilating the presents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector comprising the nucleic acid sequence. Also claimed are a vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kitch perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound that regulates the activity of one or more of the method for producing a pharmaceutical composition, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating paching and a pharmaceutical composition composition that regulates the expectition, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more of the polypeptides or their antibodies. The polynucleotide or the compound that medulates its activity is useful for preparing a medicament for treating pain (e.g. spinal segmental nerve injury (KIN)) in an animal of one or more of the composition composition of the printed contraction, but was obtained in electronic form directly from WIPO at the sequence data for this patent did not form part of the printed specification, but was obtained in electronic form directly from WIPO at the proposition to the composition of the printed contraction of the printed contraction of the printed contraction of the printed contraction of the contraction of the printed contraction of the printed contraction of the contrac
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        invention discloses a composition comprising two or more isolated rat

The invention discloses a composition comprising two or more isolated rat or human polymucleotides or a polymucleotide which represents a fragment, derivative or allelic variation of the mucleic acid sequence. Also claimed are a vector comprising the novel polymucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a chart increases or decreases the expression of the polymucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying a compound which regulates the expression of a polymucleotide sequence which is differentially a polymucleotide sequence which is differentially the expression of a polymucleotide sequence which is differentially compound that regulates the activity of one or more of the polymucleotides, a method for producing a pharmaceutical composition, a compound to a manimal of one or more of the polympetides given in the seculity in an animal of one or more of the polympetides given in the entity in an animal of one or more of the polympetides given in the compound that regulates its activity is useful for preparing a medicament for treating complates its activity is useful for preparing a medicament for treating complates its activity is useful for preparing a medicament for treating complates its activity is useful for preparing a medicament for treating complates its activity is useful for preparing a medicament for treating complates its activity is useful for preparing a medicament for treating complates its activity is useful for preparing a medicament for the sequence data for this patent did not form part of the printed complates its activity is differentially expressed during pain. Note: the sequence data for this patent did not form part of the printed contractor of the printed contractor of the printed contractor of the printed contractor of the printed contractor of the printed contractor of the printed con
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New composition comprising two or more isolated polypeptides, useful for preparing a medicament for treating pain in an animal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                           Human, receptor tyrosine phosphatase, diabetes; obesity, CNS disorder, multiple sclerosis, epilepsy; chronic obstructive pulmonary disease, COPD; Parkinson's disease, stroke, cardiovascular disorder; arthythmia; congestive heart failure; myocadial infarction; ischaemic heart disease; gene therapy; anovectic, cardiant; neuroprotective; anticonvulsant; cerebroprotective; vasotropic; antiarrhythmic; receptor; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to receptor tyrosine phosphatase proteins and polymucleotides encoding them. Sequences of the invention are useful in the preparation of medicaments for modulating the activity of receptor tyrosine phosphatase in disease such as diabetes, obesity, CNS disorders (multiple sclerosis, epilepsy, Parkinson's disease and stroke), chronic obstructive pulmonary disease (COPD) and cardiovascular disorders (e.g. congestive heart failure, myocardial infarction, ischaemic heart disease and arrhythmia). They are also used in gene therapy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; NOVX; autoimmune disease; cancer; infection; inflammatory disease; storage disorder; muscle disorder; neuroprotect; neuroprotective; antiparkinsonian; hypotemsive; hypertensive; haemostatic; cardiant; antianginal; dermatological;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides the protein and coding sequences of several novel human proteins, designated NOVX. These can be used in the treatment of, amongst others, cancers, autoimmune diseases, infections, inflammatory diseases, storage disorders, muscle disorders, neurodegenerative diseases and developmental defects. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated polypeptide, designated NOVX, useful for treating or preventing in NOVX-associated disorders e.g. cardiomyopathy, atherosclerosis, diabetes, cancer, allergy, asthma, Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; phosphatase; enzyme; chromosome 12; colon adenocarcinoma;

The invention relates to an isolated human phosphatase peptide. The human phosphatase peptides and nucleic acids are useful as models for the development of human therapeutic targets and in the identification of the tevelopment of the proteins. They also serve as targets for the development of the forman therapeutic agents that modulate phosphatase activity in cells and tissues that express the phosphatase. Experimental data indicates that the express the phosphatase. Experimental data indicates that the expressed in colon adenocarcinoma and placenta. The proteins can be used to raise or to elicit another immune response, as a reagent in assays designed to determine the levels of the protein in biological fluids, as markers for tissue in which the corresponding protein is preferentially expressed, in the identification of modulators of the polynucleotides may be used in in gene therapy, and as antisense constructs to control phosphatase gene expression in cells, tissue and organisms. The gene encoding the phosphatase of the invention is located on human chromosome 12. The current sequence represents the human chromosome 12. The current sequence represents the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                      The present invention relates to receptor tyrosine phosphatase proteins and polymucleotides encoding them. Sequences of the invention are useful in the preparation of medicaments for modulating the activity of receptor tyrosine phosphatase in disease such as diabetes, obesity. CNS disorders (multiple sclerosis, epilepsy, Parkinson's disease and stroke), chronic obstructive pulmonary disease (COPD) and cardiovascular disorders (e.g. congestive heart failure, myocardial infarction, ischaemic heart disease is human receptor tyrosine kinase protein. Receptor tyrosine kinase gene is located on chromosome 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       storage disorder; muscle disorder; neurodegenerative disorder; nootropic; developmental defect; neuroprotective; antiparkinsonian; hypotensive; hypotensive; haemostatic; cardiant; antianginal; dermatological; immunosuppressive; antialitefammatory; virucide; antibacterial; anti-HIV; antiparasitic; antiallergic; autiasthmatic; autirheumatic; antiarthritic; vulnerary; anorectic; antidiabetic; mantidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidioric carebroprotective; antidioric antidiabetic; antidioric antidiabetic; antidioric antidiabetic; antidiabetic; antidioric antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabetic; antidiabet

```

```
The invention relates to an isolated human phosphatase peptide. The human phosphatase peptides and nucleic acids are useful as models for the development of human therespeutic targets and in the identification of therapeutic proteins. They also serve as targets for the development of human therapeutic agents that modulate phosphatase activity in cells and tissues that express the phosphatase. Experimental data indicates that
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New human phosphatase peptides and nucleic acids encoding the peptides, useful as models in developing human therapeutic targets, in identifying therapeutic proteins or modulators of protein activity, and in gene
                                                                                                                                                                                                                                                                                                                                        The present invention provides the protein and coding sequences of several novel human proteins, designated NOVX. These can be used in the treatment of, amongst others, cancers, autoimmune diseases, infections, inflammatory diseases, storage disorders, muscle disorders, neurodegenerative diseases and developmental defects. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
Novel isolated polypeptide, designated NOVX, useful for treating or preventing in NOVX-associated disorders e.g. cardiomyopathy, atherosclerosis, diabetes, cancer, allergy, asthma, Crohn's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; phosphatase; enzyme; chromosome 12; colon adenocarcinoma;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          o
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    / Match 3.5%; Score 14; DB 5; Length 2300; Local Similarity 100.0%; Pred. Shimkets RA, Leach M; MPI; 2001-355949/37. Isolated human mucleic acids comprising one or more single nucleotide polymorphisms, useful for treating a subject suffering from a pathology, e.g. autoimmune diseases, ascribed to the presence of a sequence polymorphism.

Claim 1; Page 588; 674pp; English.

ABLO0010 to ABLO1104 represent human nucleic acid oligonucleotides comprising one or more single nucleotide polymorphisms (SNPs). ABB56531 to ABB56903 represent human peptides encoded by some of the SNP oligonucleotides. The sequences from the present invention can have immunosuppressive, cytostatic, antiinflammatory, neuroprotective and antimorobial activities. Nucleic acids, polypeptides, oligonucleotides and antibodies from, the present invention can be used for treating a subject suffering from, at risk for, or suspected of, suffering from a pathology ascribed to the presence of a sequence polymorphism. The pathology may be autoimmune diseases, inflammation, cancer, diseases of the nervous system, and infection by pathogenic microorganisms. The SNPs are also useful for determining which forms of a characterised

Human receptor-type protein tyrosine phosphatase - has DNA encoding it and antibodies specific for it, useful for screening drugs affecting R-ptpase activity, and detect mutant genes.

Claim 5; Fig 5A; 77pp; English.

The amino acid sequence is that of human receptor-type protein tyrosine phosphatase (R-PTPase) gamma first conserved phosphatase. It is useful in methods for screening drugs and other agents which are capable of activating or inhibiting the R-PTPase activity and thereby affecting major pathways of cellular metabolism. Activation of R-PTPases, leading no prevent or inhibit growth, and may serve as a counter-regulatory mechanism to prevent or inhibit growth, and may serve as an endogenous regulatory mechanism to prevent or inhibit growth, and may serve as an endogenous regulatory mechanism against cancer. Mutation or dysregulation of this receptor/farzyme system may promote susceptibility to cancer, diabetes, or other diseases associated with alterations in cellular phosphotyrosine metabolism. It can be used to raise antibodies which can be used in immunosalsays to determine the presence and mat. of R-PTPases, or in immunosalectron microscopy for in situ detection of R-PTPase. See also AAR20743-R20748. (Updated on 25-MAR-2003 to correct PA field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides substrate trapping mutant protein tyrosine phosphateses (PTPs). They can be used to reduce the activity of tyrosine phosphorylated proteins and to screen for modulators capable of altering the binding of protein tyrosine phosphatases to their substrate. These may be used in disease diagnosis and treatment
                                                                                                                                                                                                                                                                                                                                       New substrate trapping mutant protein tyrosine phosphatases (PTP) in which the wild type PTP catalytic domain invariant aspartate is replaced with an unphosphorylated amino acid, useful in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PTP; protein tyrosine phosphatase; tyrosine phosphorylated polypeptide; dephosphorylation; phosphotyrosine; human; PTP1B; mouse; fruit fly;

The invention relates to identifying agents which alter the interaction between a protein tyrosine phosphatase (PTP) and a tyrosine phosphatase phosphorylated polypeptide using fluorescence energy signals. The methods are useful for performing screening assay to identify agents that alter PTP binding to and PTP-mediated catalytic dephosphorylation of phosphotyrosine peptide substrates. The present sequence is that of cataltitic domain of a PTP for comparison with human PTPIR (AAG78262)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New substrate trapping mutant protein tyrosine phosphatases (PTP) in which the wild type PTP catalytic domain invariant aspartate is replaced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                   Screening assays to identify agents that alter protein tyrosine phosphatase (PTP) binding to, and PTP-mediated catalytic dephosphorylation of phosphotyrosine peptide substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                             The present invention provides substrate trapping mutant protein tyrosine phospharases (PTPs). They can be used to reduce the activity of tyrosine phosphorylated proteins and to screen for modulators capable of altering the binding of protein tyrosine phospharases to their substrate. These may be used in disease diagnosis and treatment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        between a protein tyrosine phosphatase (PTP) and a tyrosine phosphorylated polypeptide using fluorescence energy signals. The methods are useful for performing screening assay to identify agents that alter PTP binding to and FTP-mediated catalytic dephosphorylation of phosphotyrosine peptide substrates. The present sequence is that of a catalytic domain of a PTP for comparison with human PTPIB (AAG78262)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PTP; protein tyrosine phosphatase; tyrosine phosphorylated polypeptide; dephosphorylation; phosphotyrosine; human; PTP1B; mouse; fruit fly;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to identifying agents which alter the interaction
                                                                                                                                                                                                                                         Gaps

A cDNA clone was obtd. (see AAT06027) from a HeLa cell cDNA library that encoded a novel density-enhanced Type III receptor-like PTP, designated hubEP-1 (AAR85203). hubEP-1 is useful for the study of PTPs and for the development of therapeutic or prophylactic cpds. e.g. for prevention of abnormal or malignant cell growth
                                                                                                                  Density enhanced Type III receptor-like protein tyrosine phosphatase;
huDEP-1.
                                                                                                                                                                                                                                                                                                                                                           New density enhanced protein tyrosine phosphatase - used to develop prods. to modify transcription, translation and activity of tyrosine

                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeuticis and pharmaceutical Aruge. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-BPS7207). The sequence date for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

cDNA encoding RPTP-gamma was isolated from a phage lambda-gtll cDNA library of I-day-old human brain stem. The gene mapped to 3pl4.2- p21, a region deleted in certain certain and lung carcinomas, suggesting its function as a tumor suppressor gene. (Updated on 25-MAR-2003 to

                                                                                                                                                                                                                                                                                                  The invention relates to a novel isolated nucleic acid comprising a polymucleotide having a nucleotide sequence selected from 40 polymucleotides fully defined in the specification. The polymucleotide this problem is an interpretation of the invention has antiproliferative, hepatotropic, nephrotropic, antiparthritic, antiproliferative, hepatotropic, nephrotropic, antiparthritic, antipartitic, cardiant, and cytostatic activity. The polymucleotide may have a use in gene therapy. A polymucleotide or polypeptide of the invention is useful for preventing, treating or amedical condition, e.g. a proliferative disorder. They are also useful for treating e.g. liver disease, renal failure, immunological disorders including arthritis and psoriasis, cardiovascular disorders such as congenital heart defects and congestive heart failure, and condition or susceptibility to a condition in a subject. The present sequence is used in the exemplification of the invention
                                                                                                                                                                                                                             ijμ

```

DNA encoding osteoblast-testicular protein tyrosine kinase polypeptide - useful for producing recombinant polypeptide.

Claim 4; Col 33-42; 31pp; English.

The present sequence represents a rat osteotesticular protein tyrosine phosphatase (OST-PTP). CST-PTP is a transmembrane protein expressed only in bone and testis. The OST-PTP only is useful for producing recombinant protein. The invention also provides a truncated osteoblast specific form (OST) containing the OST-PTP receptor but lacking the catalytic domain. The OST-PTP protein is claimed to be useful in assays used for screening abnormal bone growth patterns and metabolic bone diseases. The OST-PTP protein is also claimed to be useful in the treatment of asteoporosis, osteopetrosis and other bone metabolic disorders

TITLE OF INVENTION: PROLATION OF A CDNA ENCODING A NOVEL
TITLE OF INVENTION: PROTEIN TYROSINE PHOSPHATASE WHICH LOCALIZES
TITLE OF INVENTION: TO FOCAL ADHESIONS AND USES THEREOF
FILE REPERENCE: 200125.409C3
CURRENT APPLICATION NUMBER: US/10/293,231
CURRENT PILENG DATE: 2002-11-12
NUMBER OF SEQ ID NOS: 13
SEQ ID NO 10
                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match 2.7%; Score 11; DB 14; Length 248; Best Local Similarity 100.0%; Pred.
